

BICONVEX ^LINE

"Your skin friend"

User's
manual

1

Pour a small amount of product on the Biconvex surface. Figure 1 suggests where to pour the product based on the body area to be treated. If the area is very extensive (i.e. the back) it is advisable to divide it into smaller areas and treat them separately. After the first few applications, you will learn how to dose the right amount of product to use.

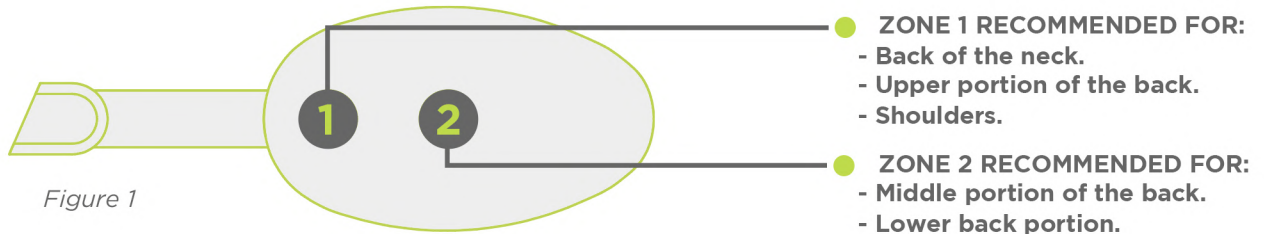

Figure 1

Pouring the product into zone 1 and 2 allows you to grip and use the Biconvex applicator more comfortably. However, you can pour the product into any other point of the applicator, according to your personal preferen-

2

Grasp the Biconvex applicator and rest the convex part of the device on the area of the body to be treated. Its surface finish manages to retain the product avoiding dripping until the start of the treatment.

3

Rub the convex surface of the Biconvex applicator onto the skin with the product just poured, exerting light pressure and distribute the product evenly until complete absorption. The loss of the initial smoothness indicates that the product used has been completely absorbed by the skin. If this happens, pour more product on the Biconvex surface and repeat until the area is completely treated. Apply the product to the skin using any type of movement, such as rotary, up and down, left - right, a mix of the movements.

4

Wash the Biconvex applicator at the end of the treatment with normal tap water and dry it. Biconvex is made with a material that does not absorb any type of creamy product therefore a few seconds of washing are enough.

5

Warnings:The Biconvex applicator surface must be treated with the utmost care. Avoid bumping it with any pointed object, especially by metal material. If the surface is damaged, stop using the applicator. It is recommended to use the Cover in the package before and after use.
